

Key findings

- AI-powered phishing and scams: Attackers use AI to craft realistic emails and direct messages, increasing the risk of credential theft, financial loss, and identity compromise. This is one of the top AI security risks identified for 2026. (Source: 8 AI Security Risks to Watch Out for in 2026 – Ricky Waters, LinkedIn)

Useful sources

1. 8 AI Security Risks to Watch Out for in 2026 – Ricky Waters — LinkedIn post (URL: <https://www.linkedin.com/posts/therickywatershow-to-use-ai-safely-in-2026-activity-7426958132272185345-TCCG>)

Limitations / missing information

- The only source available covers just one risk (AI-powered phishing) and lacks details on the other seven risks mentioned in the title. No other sources were provided to verify or expand on the topic.
- The publication date, author credentials, and full article are not accessible from the provided snippet.
- To create a thorough report on the risks of using AI in security (e.g., data poisoning, model inversion, adversarial attacks, bias, lack of explainability, etc.), additional reliable sources are required.
- The request also asks to turn this into a PDF and send it as an email. As a web research agent, I can only prepare the textual findings. I cannot generate PDF files or send emails directly. However, I can provide a summary text that you can use for the PDF and email body.

Would you like me to draft a concise summary (based on the available finding) that you can copy into a PDF and email? If you have access to more sources, please share them so I can build a more comprehensive report.
